Coffee Shop Sales Dashboard

Executive Summary | Maven Coffee Shop | New York City | 2023

Prepared by: Brinda Jat | April 2026

1. Business Context

Background

Maven Coffee Shop runs 3 locations across New York City — Hell's Kitchen, Astoria, and Lower Manhattan. This project looks at 58,202 clean transactions from January to December 2023 to understand what's driving revenue, which stores are performing well, and where there's room to improve.

Stakeholder

Sarah Mitchell
Regional Operations Manager
Maven Coffee Shop — New York City

Business Question: *Which stores and products drive the most revenue, and how is performance trending over time?*

2. Key Metrics at a Glance

Total Revenue	Total Transactions	Total Quantity Sold	Avg Order Value	Avg Revenue Per Item
$264,015	**58,202**	**82,686 units**	**$4.54**	**$3.19**

3. Key Findings

- Coffee is the top revenue driver at 41.45% ($105K), followed by Tea at 31.05% and Bakery at 12.39%. These three categories alone cover 85% of total revenue.
- Hell's Kitchen leads in store revenue at $93K. What's interesting is that all three stores are within 10% of each other, which shows consistent operations across locations.
- Monday and Wednesday see the highest transaction volumes at around 9,200 transactions each — likely driven by morning commuter footfall.
- Revenue peaked in August at $25K and dropped steadily to $19K by December. This declining trend post-August is worth investigating — it could be seasonal or operational.
- Barista Espresso alone accounts for 24.77% of product revenue, making it the single most critical product in the portfolio.
- Cumulative revenue crossed $264K by December 2023, showing steady overall growth even with the monthly dip in the second half.
- Drillthrough into the Tea category confirms Brewed Chai Tea is the top performer within Tea, contributing $30.8K across 7,096 transactions.

4. Data Quality & Methodology

Original Dataset	Rows Removed	Clean Dataset
149,116 rows	**90,914 rows**	**58,202 rows**

Reason for Removal: The original dataset had mixed date formats. After applying locale-based type conversion (English UK format) in Power Query, 90,914 rows had dates that couldn't be recovered and were excluded from analysis.

Impact: *The removed rows are roughly 61% of the original data. All findings should be read with this in mind. It's recommended to do a data collection audit to prevent similar issues in future datasets.*

5. Recommendations

#	Recommendation	Action Detail
1	**Investigate Post-August Decline**	Revenue fell from $25K in August to $19K in December. Look into staffing levels, inventory changes, or seasonal patterns before Q1 2024 planning starts.
2	**Double Down on Coffee**	Coffee drives 41.45% of revenue. Introducing new variants or running promotions in this category has the highest potential upside across all three stores.
3	**Replicate Hell's Kitchen Success**	Hell's Kitchen leads despite a similar store setup to the others. It's worth identifying what they're doing differently and applying those practices to Astoria and Lower Manhattan.
4	**Protect Barista Espresso Stock**	A single product at 24.77% of revenue is a supply risk. Keep stock consistent and consider adding a backup premium espresso option to the menu.
5	**Target Peak Days for Promotions**	Monday and Wednesday already have peak footfall at ~9,200 transactions. A loyalty offer or combo deal on these days could meaningfully push up the average order value.

6. Limitations & Future Scope

Current Limitations	Future Scope
• Single year of data — no YoY comparison possible • 61% of rows removed — findings may not reflect the full picture • No customer demographic data available • No cost data — profitability analysis not possible	• Add 2024 data for year-over-year comparison • Include customer loyalty data for segmentation analysis • Incorporate cost data for margin analysis by product • Build a forecasting model for Q1 2025 revenue projection

7. Tools & Technical Skills Demonstrated

Tools Used	Power BI Desktop │ DAX │ Power Query
Data Source	Maven Analytics (Free Dataset) — mavenanalytics.io
Data Modelling	Star Schema — 5 tables, 4 one-to-many relationships

DAX Techniques	CALCULATE, FILTER, RANKX, TOTALYTD, DATESINPERIOD, SWITCH TRUE(), VAR/RETURN, SELECTEDVALUE, SUMX, RELATED
Power Query	Date format fix with locale, type corrections, Group By, Index columns, Conditional columns, Merge queries
Dashboard Design	4-page report (Cover, Store Performance, Products & Time Analysis, Product Detail drillthrough), coffee theme, conditional formatting, dynamic titles, metric slicer, synced slicers across pages
Navigation & UX	Bookmarks + buttons for app-style page navigation, drillthrough from Product Category into detail page, custom tooltip page on hover
Theme	Custom coffee theme (JSON) — consistent palette applied across all visuals: canvas #3B1F0F, accent #C68642, text #F5ECD7
